

The emblem, made to work everywhere.

You picked **Cut Layers Emblem** — icon and name as one unit, sharing a baseline. This sheet takes it from a single drawing to a system: the variants it needs, the one rule that stops it breaking, and what it looks like on the surfaces this company actually owns — a machine door, a hard hat, a tender cover, a site board.

No photographs anywhere, deliberately. Everything below is drawn vector, so nothing depends on a photo library that doesn't exist yet, and every mockup is the real artwork rather than a picture of it.

01

The mark

One primary lockup, plus the four variants that cover every real use.

PRIMARY HORIZONTAL LOCKUP

The default. Use this anywhere there's width for it — website header, letterhead, machine door, email signature.

SAKOKHULE

TRADING (PTY) LTD

STACKED

For square and narrow spaces — a site board, a social profile, the back of a hi-vis.

ICON ONLY

Once the name is already established on the surface — an app icon, a stamped tool, a watermark.

SAKOKHULE

TRADING (PTY) LTD

ONE COLOUR

Embroidery, rubber stamp, fax, laser-etched plate, single-colour vinyl. Anywhere four inks aren't possible.

SAKOKHULE

TRADING (PTY) LTD

REVERSED

On ink, on a dark machine panel, on a photograph. The bars go to a single putty tone here rather than keeping their four colours — **blue and terracotta both lose too much separation against a dark ground to be worth keeping.**

The one rule that matters

Four fine bars is a print problem waiting to happen. This is the fix.

72px –
fine

30px – closing
up

16px –
mud

FOUR BARS, SHRINKING

72px

30px

16px – still
reads

THREE BARS, HEAVIER – THE SMALL-SIZE
CUT

Below roughly 24px on screen, or 10mm in print, switch to the three-bar cut. The top bar in the four-bar mark is 8 units wide in a 100-unit box — at 16px that's 1.3px, and it either disappears or merges into its neighbour depending on the printer. The three-bar version drops the weakest tone (the soft brown), thickens what's left and keeps the ink→blue→terracotta signature, so the mark stays recognisably the same object at a tenth the size.

CLEAR SPACE

Keep clear space of **x** on every side, where x is the thickness of the bottom terracotta bar. Nothing — no rule, no photo edge, no other logo — comes inside it. It scales with the mark, so there's one number to remember instead of a table.

03

Palette

Unchanged from the live site — the mark was built to drop in without a repaint.

Ink
#3B322A

Ink soft
#6E6151

Clay blue
#51707C

Terracotta
#A55537

Putty
#F3ECE0

Putty raise
#EAE0CE

The four bars **are** the palette — top to bottom, the mark states the whole system in order. Blue and terracotta are the old logo's steel and red, already darkened to clear 4.5:1 on putty, so every one of these pairs is measured rather than eyeballed.

04

On the plant

The most-seen surface this company owns. Two panel colours, because the fleet isn't one colour.

LIGHT PANEL — FULL COLOUR

DARK PANEL — REVERSED, ONE COLOUR

Cut as vinyl, it's two decals rather than one artwork: full colour for light machines, single putty for dark ones. Both sit on the door's flat centre panel with the clear-space rule kept — **not wrapped over a hinge line or a rivet seam**, which is where most contractor decals end up bent and unreadable.

05

On the crew

Small, one colour, and competing with hi-vis. The three-bar cut earns its keep here.

HARD HAT — THREE-BAR, 30MM

HI-VIS CHEST — ONE COLOUR, INK

On hi-vis the mark goes **one-colour ink**, never full colour: terracotta on lime is a genuinely bad pairing, and PPE is printed or embroidered in as few threads as possible anyway. Ink on hi-vis lime measures well past 4.5:1, so it stays legible at the distance a flagman is actually seen from.

Where this company actually wins work — tender covers and a card handed across a bakkie bonnet.

Company profile & capability statement

38 STATION STREET, MALELANE 1320

CARD, BACK

The four bars reappear as a rule across the tender cover — the mark's own geometry doing a second job as a page device, which is how a small system stays coherent without needing more parts. Every fact printed here is one already on the site or the CIPC record: **nothing invented for the mockup.**

SITE BOARD

AVATAR & FAVICON — THREE-BAR, REVERSED ON INK

Digital icons run **reversed on an ink tile** rather than bars-on-putty. A cream favicon disappears against a light browser tab — the exact bug found and fixed on Izanolihle's site this week, worth not repeating here.

DOCUMENT STAMP — ONE COLOUR

For signed returnables and delivery notes. Wordmark only, no icon: at stamp resolution on a rubber die the bars would fill in solid, and **the registration number is the thing a clerk is actually checking for.**

Still nothing touching the live site. Next step, when you're happy: I cut this into real files — SVG and PNG in all four variants, favicon and app icons, the OG card, and the header lockup wired into **globals.css** — then the Sakokhule site header and the company-profile PDF both swap over in one pass.

One thing worth deciding before that: the site's display face is currently **Fredoka**, but this lockup is set in **Archivo**. They can coexist (mark in Archivo, headings in Fredoka), or the site moves to Archivo and reads harder and more industrial throughout. Your call — it changes the whole site's temperature, not just the logo.
